# FORESTRY STOCK

and ★ OCT 1 1924 ★

## YOUNG TREES

### for LINING OUT

1924 - 1925

This is a select list of the best Forestry Stock and other Young Trees and Evergreens in Transplants and Seedlings we furnish in large quantities.

Conservation Commissions, Park Departments and other purchasers for public use, Private Foresters, Lumber Companies, Land Owners and Nurserymen will find in this offer attractive inducements for renewal of orders and an inducement for new business.

Prices are very low for the excellent grade and reliability of the material quoted. 250 or more of one variety furnished at the 1,000 rate; 50 or more at the 100 rate. Prices net, packing containers at cost. Orders from unknown correspondents one-half cash with order, or satisfactory reference. Any claims for errors or shortages to be reported within ten days after receipt of stock.

On account of the present widespread interest and rapidly increasing demand for all this class of planting material, we recommend early orders and reservations, whether the stock be required this autumn or at the proper time in spring.

We are pleased to submit quotations for larger quantities and other varieties not herein quoted.

## FORESTRY FOREWORD.

The rapidly disappearing forests and sources of timber supply has now become one of the leading economic problems before this country. The annual destruction by forest fires adds a continuous and important factor of loss in large areas of virgin forest and timber lands.

Of the 822,000,000 acres of forest land as estimated after careful investigation by the Select Committee on Reforestation of the U. S. Senate, approximately 469,000,000 acres, or about one-fourth of its land surface can now be classified as forest or potential forest land.

The improved methods of forest fire protection and the cordial co-operation now obtaining between the National, State and Municipal Governments, private foresters, etc., and the awakened public realization of the danger of continuing shortage in forest and timber supplies, forms a basis of hope and encouragement for the future. This trend of affairs is clearly indicated in the McNary-Clarke Forestry Bill, providing for a Federal Government expenditure appropriation of a sum up to \$5,000,000 annually for forestry protection, encouragement of forest and timber supply, etc.

The initial and responsive official action by many of the States, leading publicists, private foresters, etc., accentuates this movement for Conservation in the right direction. There is, however, a tremendous amount of waste land to be planted not in any way thus provided for, and the yearly consumption of timber still exceeds the annual growth in enormous proportion.

An effective solution toward the desired end is the present general response by private land holders and others in planting forestry areas, and the valuable part performed in the largest measure possible by many of the States.

The F. W. Kelsey Nursery Company has for many years taken a deep interest in Conservation and Forestry problems, and is now as heretofore making every effort to encourage planting of forestry stock and other young trees suitable for such planting and to keep abreast of the times in having sufficient quantities of good Forestry Stock and Lining out Trees for nurseries available at

## **A Section of Our Transplants and Seedlings**

---

as low prices as compatible with good healthy stock, true to name and well grown. That this situation is quite generally recognized is indicated by our rapidly growing business in forestry and hardy planting stock, both for public and private use.

### **WHEN TO PLANT**

Both Forestry Stock and other young Deciduous Trees and Evergreens are successfully planted both in Autumn and Spring. Evergreens for Fall planting August to October, and Deciduous Trees through September to early December. The present season promises to be a favorable planting season.

### **HOW TO PLANT**

The roots of smaller trees, seedlings or transplants, like larger trees should never be permitted to dry out, and in planting it is desirable that each tree be set a little deeper than as grown in the nursery. It is also important to have the earth pressed firmly over the roots after they are placed in natural position. For forestry or timber growth, trees are generally planted anywhere from 4 - 6 feet apart each way; planted 4 x 4 feet in the rows, 2,720 trees are required per acre; if 5 x 5 feet 1,740; if 6 x 6 feet 1,210 per acre. Transplants as a rule are more satisfactory for forestry or lining out purposes than seedlings. In this planting two men make an effective team at low cost: One man to open the hole, the other man to follow and plant; the trees being carried in a pail of muddy water until planted.
